

Project: Office Suite Signature Plug-in.

Developer: João Amado

Current Project Stage: 3 (Check this [link](#) for project details and road-map reference)

Week: 4, from July 31st to August 4th.

Summary

This report concerns the working week from 31 of July to 4 of August. This week, the necessary dialog to prompt the user on how to proceed regarding unsaved document changes was integrated with the rest of the LibreOffice plugin. The test with the latest version of the middleware was not yet conducted. This test was deemed a secondary objective by my monitor, André. Work on integrating this project with the Maven building tool as progressed. Development of the plugin for the Microsoft Office Suit started, as planned. This marked the beginning of the 3rd stage of the project (refer to the projects road-map). The last two days of the week were spent getting used to programming in C#.NET and learning its fundamentals. Given the time remaining for the project, some tests are still expected to be conducted on the LibreOffice plugin in the latest stage of the project.

TO-DO Next Week

- Implement a user interface for the plugin in the MS Office Word ribbon.
- Implement all of the LibreOffice plugins functions, including:
 - Verifying the installation of the necessary middleware in the system.
 - Checking for unsaved document changes.
 - Exporting the current document to .pdf format for later use by the middleware.
